

FRIDGE TO FORK

APP PURPOSE

Fridge → Fork is a web application that helps home cooks decide what to make based on what they actually have on hand. Users maintain a running list of the ingredients currently in their fridge and pantry, and a personal collection of saved recipes. The application continuously compares the two, sorting recipes into what can be cooked immediately versus what only needs a few missing ingredients — removing the manual work of scanning recipe cards against a mental inventory of the fridge.

The goal is to reduce food waste and decision fatigue: rather than browsing recipes and then checking ingredient-by-ingredient whether they're feasible, the app inverts the process and surfaces only what's realistically cookable right now.

KEY FEATURES

- Fridge inventory — add ingredients individually or paste a comma/newline-separated list; each item can carry an optional quantity note.
- Recipe box — save recipes with title, servings, prep time, freeform instructions, and a structured ingredient list.
- Optional ingredients — mark garnishes or substitutable items as optional so they don't block a recipe from counting as “ready.”
- Live matching dashboard (“Tonight”) — the home page groups recipes into “Ready to cook” and “Almost there,” the latter listing exactly which ingredients are missing.
- One-click restock — from a recipe's detail page, add every missing ingredient to the fridge in a single action (useful right after a grocery trip).
- Ingredient name normalization — names are trimmed and lowercased so “Garlic” and “garlic ” are treated as the same ingredient automatically.

GROUP MEMBERS

1. Elvis muriuki – He will focus on the application templates and the main layout.
2. Tabitha mburu – She will deal with the files responsible for listing and matching of recipes.
3. Jessica muna – She will deal with the files responsible for endpoint to the application and routing .
4. Mark kiriro – He will be responsible for the styling of each route of the application.
5. Wayne kiptoo – He will be responsible for the main documentation of the application.
